Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score

"An archaebacterial terminal oxidase combines core structures of two mitochondrial respiratory complexes.";

EMBO J. 11:805-812(1992).

-I. FUNCTION: THE TERMINAL OXIDASE IS THE COMPONENT OF THE RESPIRATOR CHAIN THAT CATALYZES THE REDUCTION OF OXYGEN TO WATER. SUBUNITS 1 3 FORM THE FUNCTIONAL CORE OF THE ENZYME COMPLEX.

-I. FUNCTION: SUBUNIT 2 TRANSFERS THE ELECTRONS FROM CALDARIELLA QUINOL TO THE BIMETALLIC CENTER OF THE CATALYTIC SUBUNIT 1 THAT I FORMED BY HEME A3 AND CU(B).
                                                                                                                                                                                                                                                                                                  01-FEB-1995 (Rel. 31, Created)
